Farid's Product Feasibility & Market Fit Matrix

Ghulam Farid – Business Strategy & Product Analyst

FaridStrategy | User at the center. Value at the core. Impact at scale.

Farid's Product Feasibility & Market Fit Matrix

	Low Execution Drag (Friction ≤ 3)	Moderate Execution Drag (3 < Friction ≤ 6)	High Execution Drag (Friction > 6)
Strong Market Pull (Value > 30)	EXCEPTIONAL > 2.0	HIGHLY FEASIBLE 1.2 - 2.0	FEASIBLE 0.8 - 1.2
Weak Market Pull (Value ≤ 30)	TACTICAL OPPORTUNITY 1.0 - 1.4	QUESTIONABLE 0.5 - 0.8	UNFEASIBLE < 0.5

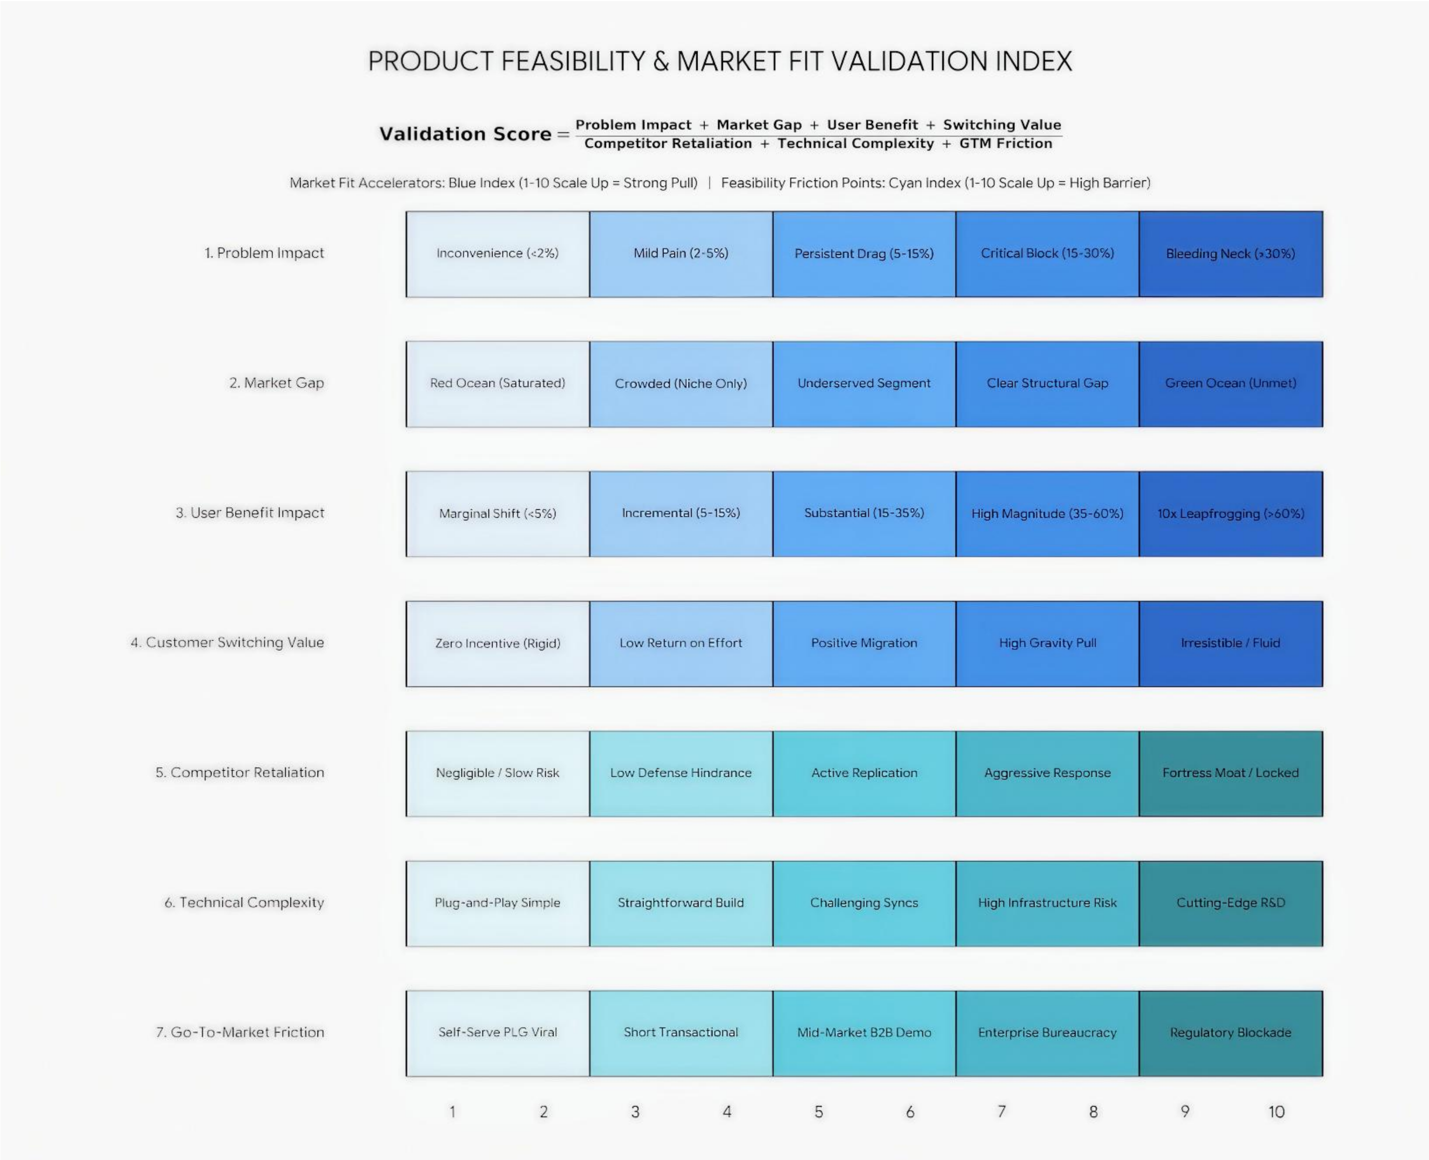
Executive Summary & Core Philosophy

Traditional prioritization models often isolate user value from commercial friction. This framework explicitly bridges that gap. By calculating the ratio between **Market Fit Accelerators** (Value Creators) and **Feasibility Friction Points** (Risks/Barriers), it ensures that you only commit engineering resources to initiatives backed by a powerful market pull.

As visualized in the layout of **image**, the system maps feature sets or standalone digital products into a clean 2x3 decision matrix based on two aggregate thresholds:

- **The Value Axis (Y-Axis):** Driven by your four Market Pull Accelerators (Total max score: 40). A score above 30 indicates a **Strong Market Pull**.
- **The Friction Axis (X-Axis):** Driven by your three Execution Friction Points (Total max score: 30). It establishes three distinct tiers: **Low, Moderate, or High Execution Drag**.

The Direct 1–10 Scoring Index



The Validation Equation

Once the scores are compiled, use the strategic equation noted at the top of **image** to compute your final index score:

$$\text{Validation Score} = \frac{\text{Problem Impact} + \text{Market Gap} + \text{User Benefit} + \text{Switching Value}}{\text{Competitor Retaliation} + \text{Technical Complexity} + \text{GTM Friction}}$$

Matrix Breakdown & Execution Protocols

Based on the intersection of your aggregate values and friction scores shown in **image_24dbd7.jpg**, categorize the initiative into its proper operational state:

State 1: EXCEPTIONAL (Score above 2.0)

- **Condition:** Strong Market Pull (Value score over 30) paired with Low Execution Drag (Friction score of 3 or less).
- **Strategic Imperative:** Immediate Execution.
- **Protocol:** This represents your highest-leverage growth engine. Skip prolonged scoping loops, fully fund the sprint cycles, and deploy directly to market to capture the wide-open gap before competitors react.

State 2: HIGHLY FEASIBLE (Score between 1.2 and 2.0)

- **Condition:** Strong Market Pull (Value score over 30) paired with Moderate Execution Drag (Friction score between 3 and 6).
- **Strategic Imperative:** Aggressive Resource Commitment.
- **Protocol:** The market demand is highly valuable, but execution hurdles exist. Focus development efforts on streamlining complex code modules or lowering the risk of core integration dependencies before scaling up marketing campaigns.

State 3: FEASIBLE (Score between 0.8 and 1.2)

- **Condition:** Strong Market Pull (Value score over 30) mixed with High Execution Drag (Friction score over 6).
- **Strategic Imperative:** Phase & De-Risk.
- **Protocol:** High-value but operationally dangerous. Do not launch as a massive, single release. Break the initiative down into smaller, low-friction micro-features or a Minimum Viable Product (MVP) to validate user adoption assumptions without absorbing massive upfront architectural risk.

State 4: TACTICAL OPPORTUNITY (Score between 1.0 and 1.4)

- **Condition:** Weak Market Pull (Value score of 30 or less) but carries Low Execution Drag (Friction score of 3 or less).
- **Strategic Imperative:** Scope Optimization / Low-Hanging Fruit.
- **Protocol:** Easy to build but won't single-handedly drive massive user growth. Implement these strictly to retain existing customers, round out product consistency, or create minor operational efficiencies if it doesn't distract from Exceptional category items.

State 5: QUESTIONABLE (Score between 0.5 and 0.8)

- **Condition:** Weak Market Pull (Value score of 30 or less) paired with Moderate Execution Drag (Friction score between 3 and 6).
- **Strategic Imperative:** Hold & Re-evaluate.
- **Protocol:** A classic product trap. It consumes meaningful development bandwidth but offers limited upside. Freeze further development until the value can be redesigned or a clearer customer pain point is discovered.

State 6: UNFEASIBLE (Score below 0.5)

- **Condition:** Weak Market Pull (Value score of 30 or less) crushed by High Execution Drag (Friction score over 6).
- **Strategic Imperative:** Kill or Immediate Pivot.
- **Protocol:** An absolute money and time pit. It offers low user returns while carrying severe technical or regulatory barriers. Shelve the initiative immediately to protect your capital and focus.

Deployment Framework Integration

To maximize the impact of this scorecard, integrate it directly into your routine roadmap planning cycles:

- **Quarterly Audits:** Run every major product initiative through the 7-factor scoring index.
- **Backlog Sorting:** Automatically plot initiatives into the table structure shown in image_24dbd7.jpg.
- **Resource Allocation Rule:** Ensure that a minimum of 70% of your engineering resources are actively deployed into the top row (Exceptional and Highly Feasible states) to maximize the speed of value delivery.
